Research Interests

My current focus is **personal AI** and **physical AI**, and the **agentic memory** that both rely on. Before this, I worked on **computer-use agents (CUAs)**, including error recovery in long-horizon tasks and joint reinforcement learning of multiple CUAs. Earlier, I worked on LLM planning and scientific summarization.

Education

The University of Texas at Dallas, Ph.D. in Computer Science, GPA 3.83/4.00 — Aug 2025 – Present
Emory University, M.S. in Computer Science, GPA 3.97/4.00 — Aug 2022 – May 2024
Renmin University of China, B.S. in Data Science and B.Econ. in Finance — Sep 2018 – Jun 2022

Research Experience

MatrAIx, Research Collaborator (persona agents) — Sep 2026 – Present

- **PersonaCUABench** (co-first author) [1]: selected and designed 44 personas in four groups across 11 domains, and evaluated nine CUA backbones (3,330 runs). Persona-phrased requests cut mean task completion from 0.689 to 0.441 (36% relative), and even fully completed persona requests receive the top satisfaction rating in only 62.7% of cases, against 84.1% for the original requests.
- Contributed to **PersonaScienceBench** [4] and the **PersonalAgentEval** leaderboard for personal agents across diverse users, preferences, and domains.

The University of Texas at Dallas, Research Assistant (advisors: Feng Chen, Bingzhe Li) — Jun 2025 – Present

- **SAFE-Mem** (first author) [2]: designed an agentic memory that accounts for both the stored content and its information source, making memory both secure and accurate. Across four LLM backbones on MPBench and LoCoMo, it has the lowest attack success among defenses that keep legitimate memory (at least 77% below the strongest of them) and the highest answer accuracy of all evaluated defenses (up to 15% higher).
- **CUA-Recovery** (co-first author) [3]: designed *ReRail*, the task and trajectory synthesis framework behind the benchmark (2,250 human-verified erroneous states for testing, 8.6K trajectories for training).

- Analyzed six agents at six takeover depths (best error-awareness rate: 44.0%) and fine-tuned Qwen3.5-35B-A3B on the training split with SFT, raising its error-awareness rate from 19.9% to 35.2% on held-out states.
- **Trustworthy CUA survey** (second author) [5]: reviewed and organized the literature on CUA security, privacy, reliability, controllability, and accountability.
- **GRASP** (first author, advised by Jessica Ouyang) [7]: designed, implemented, and evaluated a graph-reasoning planner for related-work generation.

University of Virginia, Reasoning & Knowledge Discovery Lab, Research Assistant (advisor: Sheng Li) Jun 2024 – May 2025

- Instruction-tuned LLMs to encode and reason over dynamic text-attributed graphs [6].

Emory University, AI/LLM Agents Research Group, Research Assistant (advisor: Fei Liu) Mar 2023 – May 2025

- **LLMs for planning** (first author) [8, 9, 10]: led an empirical study of LLMs as solver, verifier, and heuristic function in planning, a collection of planning benchmarks for LLMs, and a survey of LLM-assisted planning.
- **RESCUE** [11]: trained a response ranker from partial orderings over candidate LLM outputs to improve response generation.

Service and Skills

Reviewer: NeurIPS 2026, IEEE BIBM 2026, International Journal of Data Science and Analytics (IJDSA).
Languages: English (fluent), Chinese (native).
Programming: Python, PyTorch, C/C++, SQL, Bash. **Tools:** Hugging Face Transformers, vLLM, Docker, Spark.
